                                                                                                                                                                                                                                                                                       LAMIN ASSOCIATIONS.
THERE ARE THEE TYPES OF LAMINS IN HUMAN CELLS: A, B, AND C.
THE STRUCTURAL INTEGRITY OF THE LAMINA IS STRICTLY CONTROLLED BY
THE CELL CYCLE, AS SEEN BY THE DISINTEGRATION AND FORMATION OF
THE NUCLEAR ENVELOPE IN PROPHASE AND TELOPHASE, RESPECTIVELY.
ALTERNATIVE PRODUCTS: LAMINS A AND C ARE THE PRODUCTS OF ALTERNATE
SPLICING OF THE SAME GENE. THEY ARE PRESENT IN EQUAL AMOUNTS IN
FISHER D.Z., CHAUDHARY N., BLOBEL G.,
"CDNA sequencing of nuclear lamins A and C reveals primary and
secondary structural homology to intermediate filament proteins.";
PROC. NATL. ACAD. SCI. U.S.A. 83:6450-6454(1986).
-I- FUNCTION: LAMINS ARE COMPONENTS OF THE NUCLEAR LAMINA, A FIBROUS
LLAYER OW THE NUCLEOPLASMIC SIDE OF THE INNER NUCLEAR MEMBRANE,
WHICH IS THOUGHT TO PROVIDE A FRAMEWORK FOR THE NUCLEAR ENVELOPE
AND MAY ALSO INTERACT WITH CHROMATIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HEPTAD CHANGE OF PHASE.

Cloning and sequencing of cDNA clones encoding chicken lamins A and and sequencing of cDNA clones encoding chicken lamins A and Bl and comparison of the primary structures of vertebrate A- and B-type lamins.;

J. MOL. BIOL. 208:393-404(1989).

-I- FUNCTION: LAMINS ARE COMPONENTS OF THE NUCLEAR LAMINA, A FIBROUS LAYER ON THE NUCLEOPLASMIC SIDE OF THE INNER NUCLEAR MEMBRANE, WHICH IS THOUGHT TO PROVIDE A FRAMEWORK FOR THE NUCLEAR ENVELOPE AND MAY ALSO INTERACT WITH CHROMATIN.

-I- SUBCELLULAR LOCATION: NUCLEAR.

-I- SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.
                                                                                                                                                                                                                                EUKARYOTA; METAZOA; CHÓKDATA; VERTEBRATA; ARCHOSAURIA; AVES;

                                                                                   THE STRUCTURAL INTEGRITY OF THE LAMINA IS STRICTLY CONTROLLED BY THE STRUCTURAL INTEGRITY OF THE LAMINA IS STRICTLY CONTROLLED BY THE CELL CYCLE, AS SEEN BY THE DISINTEGRATION AND FORMATION OF THE NUCLEAR ENVELOPE IN PROPHASE AND TELOPHASE, RESPECTIVELY ALTERNATIVE PRODUCTS: LAMINS A, C AND C2 ARE THE PRODUCTS OF ALTERNATIVE SPLICTING OF THE SAME GENE. LAMINS A AND C ARE PRESENT IN EQUAL AMOUNTS IN THE LAMINA OF MAMMALS.
SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.
CAUTION: REF. 1 SEQUENCE DIFFERS FROM THAT SHOWN FROM POSITION 582
ONWARD AND IS LONGER (702 AA) DUE TO A FRAMESHIFT.
WHICH IS THOUGHT TO PROVIDE A FRAMEWORK FOR THE NUCLEAR ENVELOPE AND MAY ALSO INTERACT WITH CHROMATIN.
SUBCELLULAR LOCATION: NUCLEAR.
PTW: INCREASED PHOSPHORYLATION OF THE LAMINS OCCURS BEFORE ENVELOPE DISINTEGRATION AND PROBABLY PLAYS A ROLE IN REGULATING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

-1 THE STRUCTURAL INTEGRITY OF THE LAMINA IS STRICTLY CONTROLLED BY THE STRUCTURAL INTEGRATION OF THE STRUCTURAL INTEGRATION OF THE STRUCTURAL INTEGRATION OF THE NUCLEAR ENVELOPE IN PROPHASE AND TELOPHASE, RESPECTIVELY.

-1 ALTERNATIVE PRODUCTS: LAMINS A AND C ARE THE PRODUCTS OF ALTERNATE SPLICING OF THE SAME GENE. THEY ARE PRESENT IN EQUAL AMOUNTS IN THE LAMINA OF NAMMALS.

-1 SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.

-1 CAUTION: REF. I SEQUENCE DIFFERS FROM THAT SHOWN IN THE N- AND C-TERMINAL DUE TO FRAMESHIFTS.
                                                                                                                                        SEQUENCE OF 26-663 FROM N.A.

SUBMITTED (NOV-1993) TO EMBL/GENBANK/DDBJ DATA BANKS.
-I-FUNCTION: LAMINS ARE COMPONENTS OF THE NUCLEAR LAMINA, A FIBROUS
LAYER ON THE NUCLEOPLASMIC SIDE OF THE INNER NUCLEAR MEMBRANE,
WHICH IS THOUGHT TO PROVIDE A FRAMEWORK FOR THE NUCLEAR ENVELOPE
AND MAY ALSO INTERACT WITH CHROMATIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

"Regulation of glutamine synthetase II activity in Rhizobium meliloti
                                                                                                                                                                                                               THEN IS RELEASED.

-I- FUNCTION: THIS SIGMA FACTOR IS RESPONSIBLE FOR THE EXPRESSION OF THE NITROGEN FIXATION PROTEINS (NIF OPERON), GLNA AND DCTA FOR DICARBOXILATE TRANSPORT. THE OPEN COMPLEX (SIGMA-54 AND CORE RNA POLYMERASE) SERVES AS THE RECEPTOR FOR RECEIPT OF THE MELTING SIGNAL FROM THE REMOTELY BOUND ACTIVATOR PROTEINS NIFA, NIRC, OR DCTD FOR THE EXPRESSION OF THE REGULATED PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PIR; A33966; A33966.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: THIS SIGMA FACTOR IS RESPONSIBLE FOR THE EXPRESSION OF THE NITROGEN FIXATION PROTEINS (NIF OPERON), GLNA, AND DCTA FOR INCARBOXYLATE TRANSPORT. THE OPEN COMPLEX (SIGMA-54 AND CORE RNA POLYMERASE) SERVES AS THE RECEPTOR FOR RECEIPT OF THE MELLING SIGNAL FROM THE REMOTELY BOUND ACTIVATOR PROTEINS NIFA, MTRC, OR DCTD FOR THE EXPRESSION OF THE REGULATED PROTEINS.
DICARBOXYLATE TRANSPORT. THE OPEN COMPLEX (SIGMA-54 AND CORE RNA POLYMERASE) SERVES AS THE RECEPTOR FOR RECEIPT OF THE MELTING SIGNAL FROM THE REMOTELY BOUND ACTIVATOR PROTEINS NIFA, NTRC, OR DCTD FOR THE EXPRESSION OF THE REGULATED PROTEINS. SIMILARITY: BELONGS TO THE SIGMA-54 FACTOR FAMILY.

ALIGNMENTS

The excitatory animo acid receptor (See R45367) can be used to screen ligands. The ligands can be assayed for interaction by incubating them with cells, preferably occytes, expressing the receptor or with membrane preparations from these cells, and assessing any interaction by determining receptor-ligand binding or ligand-mediated ion channel activation. This method is useful in the identification of the activation. This method is useful in humans. Fragments of the receptor are useful for structural investigations and to raise antibodies. This fragment of the receptor 50 AA; 07-JUL-1994 (first entry)
Excitatory amino acid receptor (EAA4a) fragment.

M76226-W76250 are protein fragments used in the design of a model of a protein-ligand binding pocket (PLBP) of a blinding protein. A model is constructed based on typographic similarity to the binding pocket of a bacterial periplasmic binding protein. The model is refined by energy minimisation, with a high affinity ligand in the binding pocket.

Interaction energies of basis set molecules (BEW) are obtained by calculating energy of the models for the binding pocket BP and BSM individually (Er and Em) and total energy (Erm) of bound complexes individually (Er and Em) and total energy (Erm) of bound complexes inguitied ligand for a set of related PLBP's, specifically inoncropic glutamate receptor binding and activity and as modulators of receptor activity or receptor binding and activity and as modulators of receptor activity or receptor binding and activity and as modulators of receptor activity or shouland in the rapmentically, e.g. as neuroprotectants during neuropathic pain etc. The method allows affinity of ligands to be estimated withhout having to prepare them and then test them, in vitro. Ligands with high selectivity for particular glutamate receptors should have fewer side effects than known receptor antagonists.
                                                                                              02-DEC-1998 (first entry)
Bacterial periplesmic binding protein fragment #13.
Brotein-ligand binding pocket; PLBP; binding protein; ligand; modulator; bacterial periplesmic binding protein; interaction energies; ischaemia; basis set molecules; BSM; ionotropic glutamate receptors; treatment; neuroprotectant; stroke; epilepsy; neuropathic pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                               Well; 98-495386/42.
Designing a model for a ligand-binding pocket in a protein and its use for assessing ligand affinity - without the need to prepare test ligand, for identifying selective antagonists for identifying selective antagonists for identifying selective antagonists for identifying selective antagonists with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human EAA3d excitatory amino acid receptor.
excitatory amino acid receptor; human EAA3 receptor; kainate-type;
EAA3d receptor; central nervous system receptor; CNS.
Homo sapiens.

The human EAA3a receptor (R60112) and its variants EAA3b, EAA3c and EAA3d (R63068-R63070) occur naturally in human brain. They are all members of the EAA3 receptor family, having extracellular N° and C-termini and 4 internal hydrophobic domains which anchor the receptor within the cell surface membrane. The receptors bind glutamate and also exhibit binding properties characteristic of kainate-type EAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human EAA3c excitatory amino acid receptor.
excitatory amino acid receptor; human EAA3 receptor; kainate-type;
EAA3c receptor; central nervous system receptor; CNS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           receptors.

N.B. The CDNA and corresp, amino acid sequences for EAA3b, 3c and 3d do not appear in full in the specification; the sequences have been compiled by combining sequences in Figures 1 and 4 according to the description given in the disclosure.
                                                                                                                                                                                                         Polynucleotide encoding a human excitatory amino acid 3 receptor or fragment - used to assay test ligands for their interaction with a human CBS receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Identification of human CNS receptor ligand - and identification of agents that modulate editing of human CNS receptors claim 4, Fig 5, 59pp; English.

The amino acid sequence (R75883) of human EAA3 receptor deduced from a genomic DNA sequence (Q91231) differed from that deduced from EAA3 cDNA at position 591 of the mature protein; the genomic sequence coded for glutamine at this position, and the cDNA sequence for arginine. This was due to a single nucleotide change of A to G at position 2279 as a result of RNA editing. The edited and unedited positions were functionally distinct and appeared to be selectively expressed. CNS receptors subject to such editing (see also R75882 and R75884) have value in screening cpds. for potential therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-WAR-1995 (first entry)

Human EAA3b excitatory amino acid receptor.

excitatory amino acid receptor; human EAA3 receptor; kainate-type;

EAA3a receptor; central nervous system receptor; CNS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /label- signal_peptide

                                                                                                                                                                                                                                                                                                        Claim 13; Fig 1 and Fig 4B; 35pp; English.

The human EAA3a receptor (R60112) and its variants EAA3b, EAA3c and EAA3d (R63068-R63070) occur naturally in human brain. They are all members of the EAA3 receptor family, having extracellular N- and C-termini and 4 internal hydrophobic domains which anchor the receptor within the cell surface membrane. The receptors bind glutamate and also exhibit binding properties characteristic of kainate-type EAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      receptors.

N.B. The cDNA and corresp. amino acid sequences for EAA3b, 3c and 3d do not appear in full in the specification; the sequences have been compiled by combining sequences in Figures 1 and 4 according to the description given in the disclosure.
                                                                                                                                                                                                                              Polynucleotide encoding a human excitatory amino acid 3 receptor or fragment - used to assay test ligands for their interaction with a human CBS receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Glutamate receptors - used to screen for functional ligands and identify and isolate further receptors Disclosure; Fig 11: 109pp; English. GluK6 has a Mr of 100,000.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The gene and protein can be used in drug screening, to determine whether a substance is a functional ligand for the receptor by monitoring ion channel activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            25-0CT-1990; U06153.

Claim 13: Fig 1: 35pp; English.
The sequence cooling for the EAA3a receptor was isolated by probing a human foetal brain cDNA library. The EAA3a receptor and naturally occurring variants of it (i.e. EAA3b, EAA3c and EAA3d) are members of the EAA3 receptor family; they all have extracellular N- and C-termin and 4 internal hydrophobic domains which anchor the receptor within the cell surface membrane. The receptors bind glutamate and also exhibit binding properties characteristic of kainate-type EAA
                                                                                                                                                                                                                                N-PSDB; Q70097.
Polynucleotide encoding a human excitatory amino acid 3 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 52; DB 11; Length 905; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 13: Fig 1 and Fig 44: 35pp; English.

The human EAA3a receptor (R60112) and its variants EAA3b, EAA3c and EAA3d (R63068-R63070) occur naturally in human brain. They are all members of the EAA3 receptor family, having extracellular N- and C-termini and 4 internal hydrophobic domains which anchor the receptor within the cell surface membrane. The receptors bind glutamate and also exhibit binding properties characteristic of kainate-type EAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                22-MAR-1995 (first entry)
12-MAR-1995 (first entry)
Human EAA3a excitatory amino acid receptor.
EAA3a receptor; kainate-type;
EAA3a receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                receptors.

N.B. The CDNA and corresp, amino acid sequences for EAA3b, 3c and 3d do not appear in full in the specification; the sequences have been compiled by combining sequences in Figures 1 and 4 according to the description given in the disclosure.

Sequence 905 AA;
                                                                                                                                                                                                                                                                                                                             N-PSDB; 081156.
Polynuclectide encoding a human excitatory amino acid 3 receptor or fragment - used to assay test ligands for their interaction with a human CBS receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Excitatory aminoacid for receptors with kainate binding activity used to test ligands for CNS receptor interaction to identify cpds. useful against CNS disorders

Trougs. useful against CNS disorders
Claim 13: Figure 1: 37pp; English.
The excitatory amino acid receptor can be used to screen ligands.
The ligands can be assayed for interaction by incubating them with cells, preferably occytes, expressing the receptor or with membrane preparations from these cells, and assessing any interaction by determining receptor-ligand binding or ligand-mediated ion channel cativation. This method is useful in the identification of the receptor are useful for structural investigations and to raise antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid encoding human excitatory aminoacid receptors - used for producing receptors and in assays for test ligands for binding to human CNS receptors.

Claim 12; Page 16-19; 34eppic. Bnglish.

Nucleotides which encode the excitatory amino acid receptors (EAA's)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                07-JUL-1994 (first entry)

Excitatory amino acid receptor (EAA4a receptor).

Excitatory amino acid receptor; EAA4a; screening; detection; identification; CNS; nervous disorders; antibody; oocyte; membrane protein; ion-channel; therapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Excitatory amino acid receptor (EAA5).

can be used for the production of the receptors, to identify sequence related genes or for locating the receptor encoding DNA in a specimen. Recombinant cells which produce the receptors, or their membrane preparations, can be used for assaying a test ligand for binding to a human CNS receptor to develop therapeutics. The receptors can themselves be used in the production of antibodies for use in detection methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Excitatory aminoadd for receptors with kainate binding activity

used to test ligands for CNS receptor interaction to identify

reds. useful against CNS disorders

Disclosure: Figure 3a: 7pp: English.

The excitatory amino acid receptor EAA4a can be used to screen

ligands. The ligands can be assayed for interaction by incubating

the with cells, preferably occytes, expressing the receptor or with

membrane preparations from these cells, and assessing any

interaction by determining receptor-ligand binding or

ligand-mediated ion channel activation. This method is useful in

the identification of therapeutics useful to treat CNS disorders in

humans. Fragments of the receptor are useful for structural

investigations and to raise antibodies. This fragment of the

receptor EAA4b corresponds to amino acid residues 700 to 750 and has

caparitic acid at position in receptor EAA4a.

A mutant IR is claimed which may have a mutated alpha-chain, esp.
the precursor processing site. The beta-chain may be mutated, e.g.
by deletion of the transmembrane sequence; the tyrosine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        activity may be inactivated. Fig. 5 is a comparison of oncogene a human EGF receptor sequences with that of HIR in the cytoplasmic domain of the insulin receptor beta subunit.

Sequence 259 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              synthesis of receptor and mutants for therapeutic and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (GETH ) GENENTECH INC.

```
This sequence represents an alpha-2,3-sialyltransferase which has been isolated from Neisseria meningitidis. The protein can be used as a reagent for adding a slalic acid residue to an acceptor having a terminal galactose residue, e.g. in synthesis of biologically active oligosaccharides or sialyl-modified proteins or lipids. The nucleic acid sequence can be used for the recombinant production of sequence 371 AA,
                                                                                                                                                                                                             Nucleic acid sequence encoding Neisseria alpha-2,3-sialyl:transferase - useful to add sialic acid to acceptor with terminal galactose residue for synthesis of biologically active cliquasaccharide cliquas 38; 50pp; English.

MANY STNAPSES IN THE CENTRAL NERVOUS SYSTEM. THE POSTSYNAPTIC ACTIONS OF GLIG ARE MEDIATED BY A VARIETY OF RECEPTORS THAT ARE NAMED ACCORDING TO THEIR SELECTIVE AGONISTS. MAY BE INVOLVED IN THE TRANSMISSION OF LIGHT INFORMATION FROM THE RETINA TO THE HYPOTHAAMUS. THIS RECEPTOR BINDS KAINATE > QUISQUALARE.

CHARACTERIST THE RESERVE OF GLUTAMINE RESIDUE (NON-EDITED) DETERMINES CHANNELS CHANNELS (EDITED) DETERMINES A HIGHER CALCIUM PERMEABILITY ESPECIALLY IF DESCRIBED THE STRUCTURES (90% OF THE DECEMBER EDITED. THIS RECEPPOR IS NEARLY DESCRIBED. THE DESCRIBED IN ALL GRAY MATTER STRUCTURES (90% OF THE DECEMBER EDITED.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
SUBUNIT: ASSEMBLE INTO A KAINATE-GATED HOMOMERIC CHANNEL THAT DOES
NOT BIND AMPA. GRIKZ ASSOCIATED TO GRIKS FORMS FUNCTIONAL
CHANNELS, THAT CAN BE GATED BY AMPA.
TISSUE SPECIFICITY: HIGHEST EXPRESSION IS FOUND IN THE OLFACTORY
LOBE, PIRIFORM CORTEX, DENTATE GYRUS, HIPPOCAMPUS, GRANULAR CELL
                                                                                                                                                                          Gaps

LINEURREPORT 5:2625-2629(1994).

CHONGINEL L-GUITAMATE ACTS AS AN EXCITATORY NEUROTRANSMITTER AT MANY SYNASES IN THE CENTRAL NERVOUS SYSTEM. THE POSTSYNAPTIC ACTIONS OF GLU ARE MEDIATED BY A VARIETY OF RECEPTORS THAT ARE NAMED ACCORDING TO THERR SELECTIVE ACONISTS. MAY BE INVOLVED IN THE TRANSMISSION OF LIGHT INFORMATION FROM THE RETINA TO THE HYPOTHALAMUS: THIS RECEPTOR BINDS DOMOATE > KAIRATE > L-GLUTAMATE > COUSCULLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

CHOSOGLALITE > CNOX = DNOX > AMPA > DIHYDROKAINATE > NMDA.

CHOSOGLALICAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

CHOSOGLATED YEASON (Q) ASSEMBLES INTO A FUNCTIONAL KAINATE-GATED HOMOMERIC CHANNEL, WHEREAS THE EDITED VERSION (R) IS UNABLE TO PRODUCE CHANNEL ACTIVITY WHEN EXPRESSED ALONE. BOTH EDITED AND UNEDITED VERSIONS CAN FORM FUNCTIONAL CHANNELS WITH GRIK4 AND GRIK5 (BY SIMILARITY).

CHOSOGRAPH OF THE UNCOTAGE CAN STANDANT IN THE CEREBELLUM AND THE SUPRACHIASAMTIC NUCLEIL (SCN) OF THE HYPOTHALAMUS.

CHOSOGRAPH OF THE COURT OF THE LIGAND-GATED IONIC CHANNELS FAMILY.

CHOSOGRAPH OF THE LIGAND-GATED IONIC CHANNELS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NR MIN: 138245; -.

CELL MOL. GENET. 19:581-588(1993).
-1- FUNCTION: L-GLUTAMATE ACTS AS AN EXCITATORY NEUROTRANSMITTER AT MANY SYNAPSES IN THE CENTRAL NERVOUS SYSTEM. THE POSTSYNAPTIC ACTIONS OF GLU ARE MEDIATED BY A VARIETY OF RECEPTORS THAT ARE NAMED ACCORDING TO THEIR SELECTIVE AGONISTS. THIS RECEPTOR BINDS DOMOATE > KAINATE >> L-GLUTAMATE = QUISQUALATE >> AMPA = NNDA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Disclosure; p; English.
Claimed replicon comprises a promoter and regulatory regions, capable of expressing alkaline and neutral protease genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ë
                                                                                                                                                                                                                                                      Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids encoding it - useful for more accurate detection of HEV in samples, using immuno-assays and nucleic acid hybridisation Claim 10; Page 17-24; 29pp; Japanese.
This sequence represents a Hepatitis E viral hollow particle protein. This polypeptides can be used to raise antibodies to detect HEV infection in samples, e.g. by immuno-assay based techniques, and the nucleic acid can be used for the same in nucleic acid hybridisation assays. The polypeptides and nucleic acids allow more accurate detection of HEV than previously possible.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            572 frtsfydgavleangperynlsfdasqstmaagpfsptyaasaaglevryvaagldhrav 631

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant plasmid used in beer prodn. - obtd. by integrating lichenase gene derived from Bacillus subtilis, into vector Disclosure; Fig 4: 7pp; Japanese.

The lichenase gene from Bacillus subtilis Y-25 is used for transforming Bacillus hosts so that they show increased lichenase expression. The recombinant lichenase enzyme produced by the transformants is useful in beer production for decomposing betaglucan from barley.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bacillus to direct expression of poly:peptide Disclosure; Fig 4: 37pp; English.
The inventors claim a vector comprising a replicable plasmid containing the promoter and regulatory region of a gene selected from apr[BamP] and npr[BamP], for transformation of Bacillus to direct expression of polypeptide.

New thermostable (1,3-1,4)-beta-glucanase - prepd. using hybrid gene obtd. using Bacillus amyloliquefaciens and B.macerans genes blscloure; page 26; 84pp; English.

This hybrid protein is encoded by the beta-glucanase-H1 gene.

Following processing of the signal peptide the mature protein is produced, comprising the amino terminus of the amylolique-faciens beta-glucanase and the carboxyl-terminal half of the B.macerans beta-glucanase. This hybrid protein is thermostable and hydrolyses beta-glycosidic linkages in (1,3-1,4)-beta-glucans. C. Reducing sugars are obtd. at high temps. and thus this enzyme can be used in the mfr. of food prods., esp. beer and animal feed (eg for feeding poultry). See also Q05833.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein production
Disclosure; Columns 55-64, 45pp; English.
W71209-11 represent the proteins encoded by the open reading frames (ORFs) of the DNA sequence of the Burmese isolate of an enterically transmitted nonA/AnnaB viral haptitis agent (ET-NAME). The nucleic acid sequence may be used for identifying and sequencing the entire viral agent (also referred to as HEV), detecting ET-NAME in Infected samples, e.g. by specific amplification of virus-derived DNA sequences and for producing recombinant viral proteins for use in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     30-OCT-1998 (first entry) Protein encoded by ORF 1 of the Burmese isolate of ET-NANB. Enterically transmitted nonA/nonB hepatitis virus; identification; HEV; ET-NANB; detection; vaccine.
